Technical Risk Register

8 Identified Risks with Mitigations

Prepared for ConvergeFlow

April 2026

Bold ideas wait for no one

This document identifies and assesses 8 technical risks for the ConvergeFlow platform. Each risk is scored on likelihood (1-5) and impact (1-5) to produce a risk score. Mitigations and ownership are assigned for active management.

#	Risk	Severity	Like.	Impact	Score	Owner
1	ESP Prohibition	CRITICAL	4	5	20	Kareem
2	LLM Cost Escalation	HIGH	3	4	12	Kareem
3	Domain Rep. Damage	HIGH	3	4	12	Cristiano
4	Lead Data Quality	MEDIUM	3	3	9	Kareem
5	Mailforge Dependency	MEDIUM	2	4	8	Cristiano
6	Scaling Degradation	MEDIUM	2	3	6	Cristiano
7	CAN-SPAM Compliance	MEDIUM	2	4	8	Kareem
8	OpenClaw Reliability	LOW-MED	2	3	6	Kareem

Risk 1: ESP Prohibition Risk

Severity	Likelihood	Impact	Score	Owner	Status
CRITICAL	4	5	20	Kareem Maize	MITIGATED - Mailforge selected

Description

Traditional ESPs (Mailgun, AWS SES, SendGrid) have strict anti-cold-email policies. Cold outreach violates their Terms of Service. Using these providers risks account suspension, loss of sending infrastructure, and potential legal exposure.

Mitigations

- Mailforge is purpose-built for cold email infrastructure and does not prohibit outreach
- No dependency on traditional ESPs eliminates TOS violation risk entirely
- Mailforge handles DNS configuration, warm-up, and IP rotation within their platform
- Contractual agreement with Mailforge explicitly covers cold email use case

Risk 2: LLM Cost Escalation

Severity	Likelihood	Impact	Score	Owner	Status
HIGH	3	4	12	Kareem Maize	ACTIVE - Monitoring Ollama stability

Description

GPU clusters for self-hosted LLM inference cost approximately \$2,000/month. If Ollama changes pricing, degrades service, or goes offline, the AI email generation capability is at risk.

Mitigations

- Start with Ollama at \$20/month flat rate (not token-based)
- Document migration path to self-hosted GPU cluster for scale
- Keep model requirements flexible: GLM-5 and Minimax 2.7 are both viable
- Monitor Ollama service reliability and pricing changes monthly
- Budget \$2k/month GPU cluster as growth milestone

Risk 3: Domain Reputation Damage

Severity	Likelihood	Impact	Score	Owner	Status
HIGH	3	4	12	Cristiano Varriale	ACTIVE - Controls in place for MVP

Description

Users who bring blacklisted domains or use poor-quality lead lists could damage the platform's overall reputation with email providers. Shared IP addresses mean one bad actor can affect deliverability for all users.

Mitigations

- EULA and in-app disclaimers assign list quality responsibility to users
- Low send limits (20-50/day) prevent rapid reputation damage
- Quality-over-volume approach reduces spam complaints
- Mailforge pre-send verification catches invalid addresses
- Bounce rate monitoring pauses campaigns automatically if bounces exceed 5%

Risk 4: Lead Data Quality

Severity	Likelihood	Impact	Score	Owner	Status
MEDIUM	3	3	9	Kareem Maize	ACTIVE - Multi-provider strategy implemented

Description

API lead sources may return stale, incorrect, or duplicate data. Poor lead quality directly impacts email deliverability and user satisfaction.

Mitigations

- Multi-provider strategy reduces single-source dependency
- Data freshness tracking system flags leads older than 90 days
- Pre-send email verification catches invalid addresses
- Future phase: proprietary scraping capability for higher-quality leads

Risk 5: Single Provider Dependency - Mailforge

Severity	Likelihood	Impact	Score	Owner	Status
MEDIUM	2	4	8	Cristiano Varriale	ACCEPTED - Monitoring in place

Description

The entire email infrastructure depends on Mailforge. If Mailforge experiences downtime or discontinues service, ConvergeFlow cannot send emails.

Mitigations

- Mailforge provides a documented API for all integrations
- Integration points documented for potential provider swap
- Monitor Mailforge reliability metrics monthly
- Evaluate backup providers quarterly (without active integration)

Risk 6: Scaling Without Degradation

Severity	Likelihood	Impact	Score	Owner	Status
MEDIUM	2	3	6	Cristiano Varriale	MITIGATED - Growth controls designed

Description

Uncontrolled user growth could degrade deliverability for existing users. Shared infrastructure means capacity is finite.

Mitigations

- 'Book a Call' CTA gates all scaling requests
- Manual approval process ensures capacity matches infrastructure
- Low default send limits keep per-user resource consumption predictable
- Infrastructure scaling plan documented for growth milestones

Risk 7: CAN-SPAM / Regulatory Compliance

Severity	Likelihood	Impact	Score	Owner	Status
MEDIUM	2	4	8	Kareem Maize	ACTIVE - Legal review pending

Description

Cold email must comply with CAN-SPAM (US), CASL (Canada), GDPR (EU), and other regional regulations. Non-compliance risks fines and platform shutdown.

Mitigations

- EULA includes compliance requirements for all users
- Mandatory unsubscribe links in every outgoing email
- Low send limits reduce regulatory exposure
- Opt-out mechanisms meet CAN-SPAM requirements
- Legal review of EULA before launch

Risk 8: OpenClaw Reliability for DWY Tier

Severity	Likelihood	Impact	Score	Owner	Status
LOW-MEDIUM	2	3	6	Kareem Maize	ACCEPTED - Limited launch scope

Description

OpenClaw is open-source and still maturing. Kareem noted difficulty running it on Mac. If OpenClaw fails during DWY operations, customer experience degrades.

Mitigations

- Position DWY as premium tier with limited capacity (max 20 clients at launch)
 - Manual fallback process documented for OpenClaw agent failures
 - WhatsApp communication channel allows human intervention when agent fails
 - Monitor OpenClaw project development and community stability
-
